

NEW IM-10UA/BA solves the following problems!

Compact and lightweight

Reduced installation workload

Compatible with "TML-NET"

Small diameter guide pipes

High resolution

Easy to handle

Compact and lightweight

1 Are you having trouble transporting or storing your multi-layer inclinometer?

Compact and lightweight

Reduced transportation workload

NEW IM-UA/BA
Eliminated restrictions during transportation of conventional inclinometers!
- Cannot be laid horizontally
- Vulnerable to shock

Transported conventionally in a tall, vertical box.
⇒ Large volumetric weight (transported in a high-top van etc.)

NEW IM-UA/BA
Downsized overall length by 20%
Reduced mass by 43%
*Compared to NKB-MF

IM-UA/BA is compact and OK to lay horizontally
⇒ Space saving by horizontal storage in a box (OK to transport in a station wagon)

2 Why don't you easily automate the multi-layer inclinometers?

Reduced labor/cost during installation/measurement, and maintenance costs resulting from cable deterioration.

A: Insertion-Type Inclinometer

- Only one sensor unit. The measurer moves the sensor position and conducts the measurement.
- Easy installation
- No automated/unattended observation

In the event of long-term measurement:
Increased workload and man-hours

B: Multi-layer Inclinometer

- Equally spaced sensor units
- Simultaneous measurement of entire measurement length
- Automated/unattended observation

Installation workload/costs: Costly maintenance

C: Networkable Multi-layer Inclinometer

Automated/unattended long-term observation:
Significant cost savings during measurement
Maintenance is easy as well

NEW

3 Is it troublesome to install a multi-layer inclinometer because of many cables to connect/wire?

Significant reduction in wiring

- Easier adjustment of cable length according to wiring route/depth
- Easy installation even at sites with unfavorable environments

Network-Type Measuring System "TML-NET"

- Equally spaced multiple sensor units along the vertical measurement length
- Cables for sensors are connected to each other for ease of installation
- High noise durability with digital transmission

4 The more multi-layer inclinometers, the thicker the guide pipe becomes?

NEW Guide pipes for IM-UA/BA

Compatible with small diameters!

Aluminum Guide Pipe $\phi 50\text{mm}$ IM-GP

$\phi 56, \phi 61\text{mm}$
Roller for Guide Pipes

Aluminum Guide Pipe $\phi 56\text{mm}$ KBF-31

NEW IM-10UA
X-axis sensitivity direction (-) (+)

$\phi 50\text{mm}$ Guide pipe
 $\phi 50\text{mm}$ Roller for Guide Pipes

NEW IM-10BA
X-axis sensitivity direction (-) (+)

$\phi 50\text{mm}$ Guide pipe
Y-axis sensitivity direction (+) (-)

Resin Guide Pipe $\phi 61\text{mm}$ KBF-51

5 More! Compatible with conventional "TML-NET" measurement systems

Network-type measurement system that realizes significant reduction in wiring and easy expansion of measurement system

Easy wire connection and branching

No sensitivity loss caused by cable extension

No influence due to degradation of insulation resistance

Can also be used simultaneously with switch box (when TDS is used)

Cost reduction by reduced wiring

Easy installation by compact and lightweight module unit

Highly resistant to noise due to digital processing in immediate vicinity of sensor

Network module total extension distance maximum 2 km

Isolated between individual measuring instrument

The network-type measurement system TML-NET has high noise resistance with its decentralized layout and digital transmission and can aggressively be used for on-site measurement in unfavorable environments. Furthermore, additions/branches of measurement points are easy in accordance with the progress of the construction work.
